POLIO IMMUNIZATION IS THE PROCESS OF PROTECTING INDIVIDUALS FROM POLIOMYELITIS (POLIO)
THROUGH VACCINATION.

Types of Polio Vaccines

- ➤ Oral Polio Vaccine (OPV)
- ► Inactivated Polio Vaccine (IPV)

Types of Polio Vaccines

Oral Polio Vaccine (OPV)

Contains a weakened form of the poliovirus.

- •Given as oral drops.
- Provides intestinal immunity, which helps prevent the spread of the virus.
- •Used widely in mass immunization campaigns

Types of Polio Vaccines Inactivated Polio Vaccine (IPV)

Contains an inactivated (killed) poliovirus. Given as an injection.

Importance of Polio Immunization

- Prevents paralysis and death caused by poliovirus.
- Stops the spread of polio within communities.
- Helps achieve global eradication to ensure future generations are poliofree.
